## **Question 12.13.3.49**

Let *X* be a discrete random variable whose probability distribution is defined as follows:

$$\Pr(X = x) = \begin{cases} k(x+1) & , x = 1, 2, 3, 4\\ 2kx & , x = 5, 6, 7\\ 0 & , otherwise \end{cases}$$

where k is a constant. Calculate

- (i) the value of k
- (ii) E(*X*)
- (iii) Standard deviation of X

## **Solution:**

(i) the value of k:

Using the third axiom of probability,

$$\sum_{i=1}^{n} p_X(i) = 1 \tag{1}$$

We get,

$$2k + 3k + 4k + 5k + 10k + 12k + 14k = 1$$
 (2)

$$50k = 1$$
 (3)

$$k = 0.02$$

(4)

(ii) E(X):

$$E(X) = \sum_{i=1}^{n} x_i p_X(i)$$
 (5)

$$E(X) = 2k + 6k + 12k + 20k + 50k + 72k + 98k$$
(6)

$$= 260k \tag{7}$$

$$= 260 \times 0.02$$
 (8)

$$= 5.2$$
 (9)

(iii) Standard deviation of X:

$$Var(X) = E(X^{2}) - [E(X)]^{2}$$
 (10)

$$= \sum_{i=1}^{n} x_i^2 p_X(i) - \left[ \sum_{i=1}^{n} x_i p_X(i) \right]^2$$
 (11)

$$= 1498k - (5.2)^2 \tag{12}$$

$$= 1498 \times 0.02 - 27.04 \tag{13}$$

$$= 2.92$$
 (14)

Standard deviation of X is

$$X = \sqrt{Var(X)} \tag{15}$$

$$=\sqrt{2.92}$$
 (16)

1

$$=1.7\tag{17}$$
